Building Reports, Dashboards, and Custom Pages (UI Builder) for the Gym Membership Enrollment Application in Zoho Creator

AIM

To design and build custom reports, an interactive dashboard, and a custom page using Zoho Creator's UI Builder for the Gym Membership Enrollment application, so that the front desk and trainers can visualize enrollment trends, filter member data, and carry out onboarding actions through purpose-built interfaces layered on top of the base Membership_Enrollment_Report.

PROCEDURE

The front desk's and trainers' information needs were first reviewed against the existing Membership_Enrollment_Form data, identifying the need for pre-filtered report views, an at-a-glance dashboard, and a single onboarding page combining form, report, and quick actions.

From the Reports panel, four custom report views were created on top of Membership_Enrollment_Form data: Active_Members_List (a List Report filtered to New Member and Renewal records and sorted by Preferred_Start_Date), Plan_Wise_Report (a List Report grouped by Membership_Plan to compare enrollment counts across plans), Trainer_Assignment_Board (a Kanban View with columns by Preferred_Activities), and Upcoming_Start_Dates (a Calendar View plotting Preferred_Start_Date). Each report's Criteria pane was used to set the filter conditions above, and the Columns option was used to hide fields not relevant to that view.

A new dashboard, Gym_Front_Desk_Dashboard, was then created from the Dashboards panel. Four widgets were added and bound to the reports above: a KPI widget (Total_Enrollments_KPI) showing a running count of enrollments, a Pie Chart widget (Plan_Distribution_Chart) built on Plan_Wise_Report, a Bar Chart widget (Activity_Popularity_Chart) built on Trainer_Assignment_Board, and a Table widget (Upcoming_Arrivals_Table) built on Upcoming_Start_Dates to list members arriving in the next 7 days. Widgets were arranged with the KPI at the top, the two charts side by side beneath it, and the table spanning the bottom, with a global date-range filter added to refresh all widgets together.

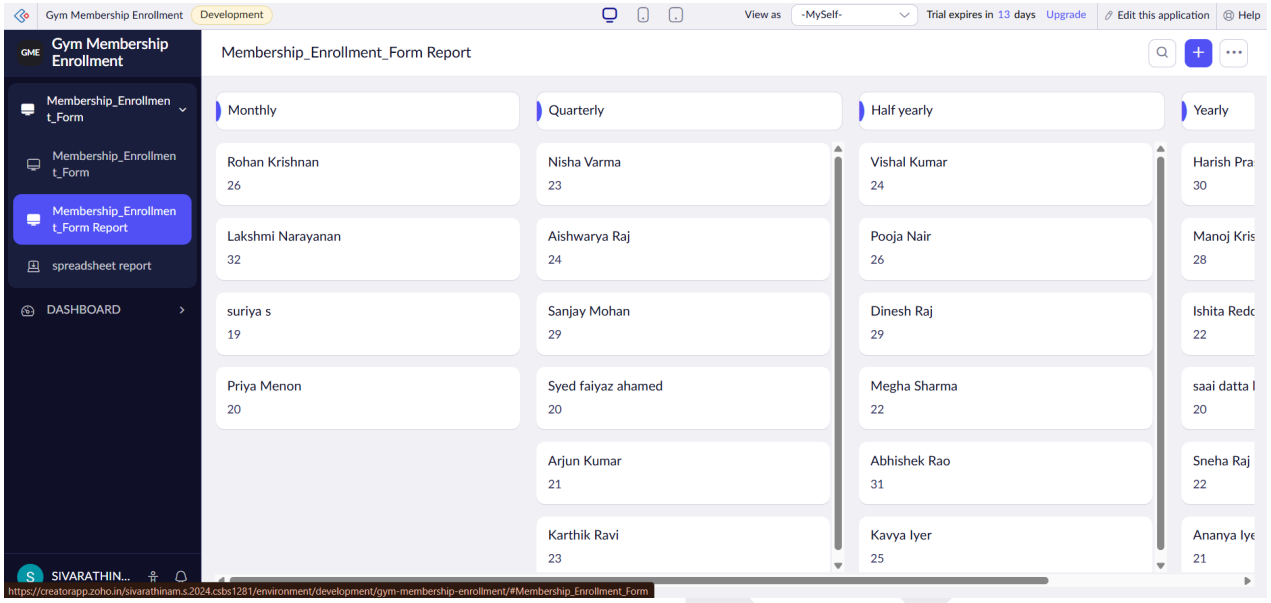

A custom page, Member_Onboarding_Page, was built using the drag-and-drop UI Builder. Layout containers were added to divide the page into regions: a Form component embedding Membership_Enrollment_Form at the top for registering walk-in members, a Report component embedding Active_Members_List in the middle for verifying existing members, the two chart widgets placed to the side for quick reference, and custom action buttons — “Assign Trainer” and “Send Welcome Email” — added at the bottom. Deluge scripts were attached to each button: the Assign Trainer button updates a hidden Assigned_Trainer field based on the member's Preferred_Activities, and the Send Welcome Email button sends a templated confirmation email using the record's Email_Address.

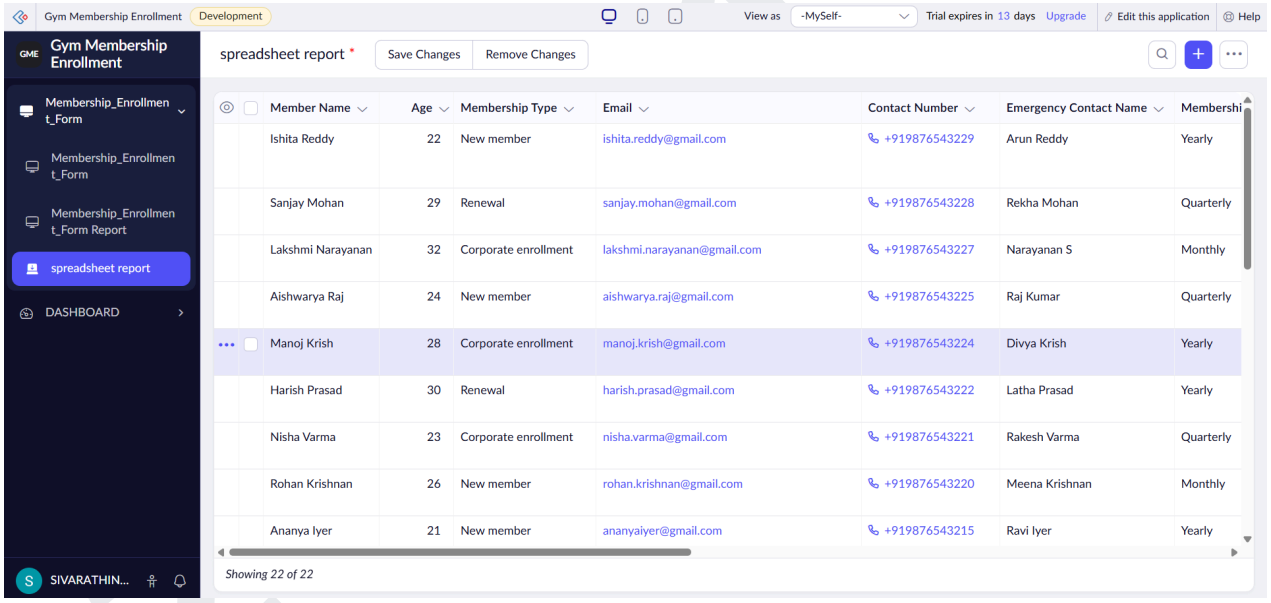

Finally, the dashboard and custom page were previewed to confirm all widgets, embedded components, and buttons rendered and functioned correctly against live data, both action buttons were tested end-to-end on sample records, and the application was published with edit access restricted to administrators.

The above screenshots are the formulas and edits made for dashboard

RESULT

Custom report views, an interactive dashboard, and a custom onboarding page were successfully built in Zoho Creator for the Gym Membership Enrollment application using the platform's Reports module, Dashboard Builder, and UI Builder. Four purpose-built report views were configured to match front-desk, trainer, and management needs; a dashboard combining KPI, pie, bar, and table widgets was built on top of these reports; and a custom page embedding the form, a report, charts, and Deluge-scripted action buttons was assembled to give front-desk staff a single onboarding workspace. The exercise thus demonstrated how raw form data can be progressively layered into reports, dashboards, and custom pages to support a real front-office workflow.
