Experiment 8: Configuring User Management and Role-Based Access Control (RBAC) in a Zoho Creator Application

SIVARATHINAM S

ROLL NO: 241401102

Aim

To configure user management and role-based access control (RBAC) in the "Gym Membership Enrollment & Front Desk Management" application, so that each type of user can access only the forms, reports and actions they need, while the enrollment form remains publicly available to prospective members.

Application Details

- **Application Name:** Gym Membership Enrollment & Front Desk Management
- **Form:** Membership_Enrollment_Form
- **Report:** Membership_Enrollment_Report
- **Users:** Gym Manager, Front Desk, Trainers and prospective members (public)

Concepts Used

Concept	Description
User	A person who can access the application after being added by the admin
Permission set	A set of rules that controls what a user can do (view, add, edit, delete) in each form and report. Read and Write are the default sets; custom sets can be created
Role	A position in the organization hierarchy, such as Gym Manager above Front Desk and Trainer
Data sharing rule	A rule that lets selected users or roles access records beyond what the role hierarchy allows
Publish	Creates a public link so a form can be used without a Zoho Creator account

241401102

Access Plan

Role	Who	Access
Gym Manager	Owner	Full access to all forms, reports and the dashboard, including delete
Front Desk	Receptionist	View, add and edit enrollments; no delete
Trainer	Trainers	View only; no add, edit or delete
Public	Prospective members	Submit the enrollment form only, through the published link

Procedure

1. Opened the application and went to **Settings, Permissions, User Permissions**.
2. In the **Permissions** tab, created the permission sets Manager, Front Desk and Trainer, and set view, add, edit and delete access for the form and the report.
3. In the **Roles** tab, created the role hierarchy with Gym Manager at the top and Front Desk and Trainer below it.
4. Opened **Users** from the Creator home page and added the test users, assigning a permission set and role to each.
5. Used the **Share** option to share the application with the added users.
6. Created a data sharing rule so the required roles can see the enrollment records.
7. Opened **Operations, Publish**, and published only Membership_Enrollment_Form to generate its permalink.
8. Tested the public link in an incognito window and tested each role by logging in as that user.

Users and Permissions Configured

User	Role	Permission Set
Application owner	Gym Manager	Manager
sivarathinam401	Front Desk	Manager (edit as per your setup)
Trainer test user	Trainer	Trainer

Testing

Test Case	Expected Result	Actual Result
Public link opened without login	Enrollment form loads and can be submitted	Passed
Public submission	Record is saved, confirmation email and CRM lead are created	Passed

2414010102

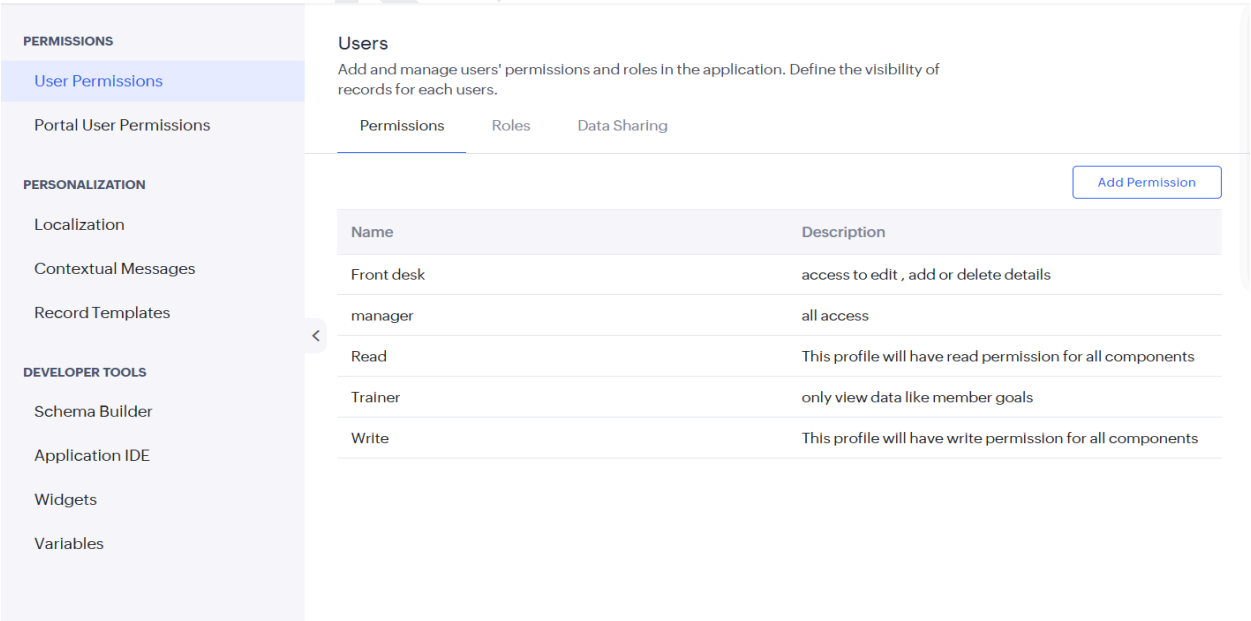

Test Case	Expected Result	Actual Result
Login as Front Desk user	Can view, add and edit enrollments; delete not available	Passed
Login as Trainer user	Can only view the report; add, edit and delete not available	Passed
Login as Manager	Full access to all components	Passed
Report and dashboard opened without login	Not accessible publicly	Passed

Issues Faced and Fixes

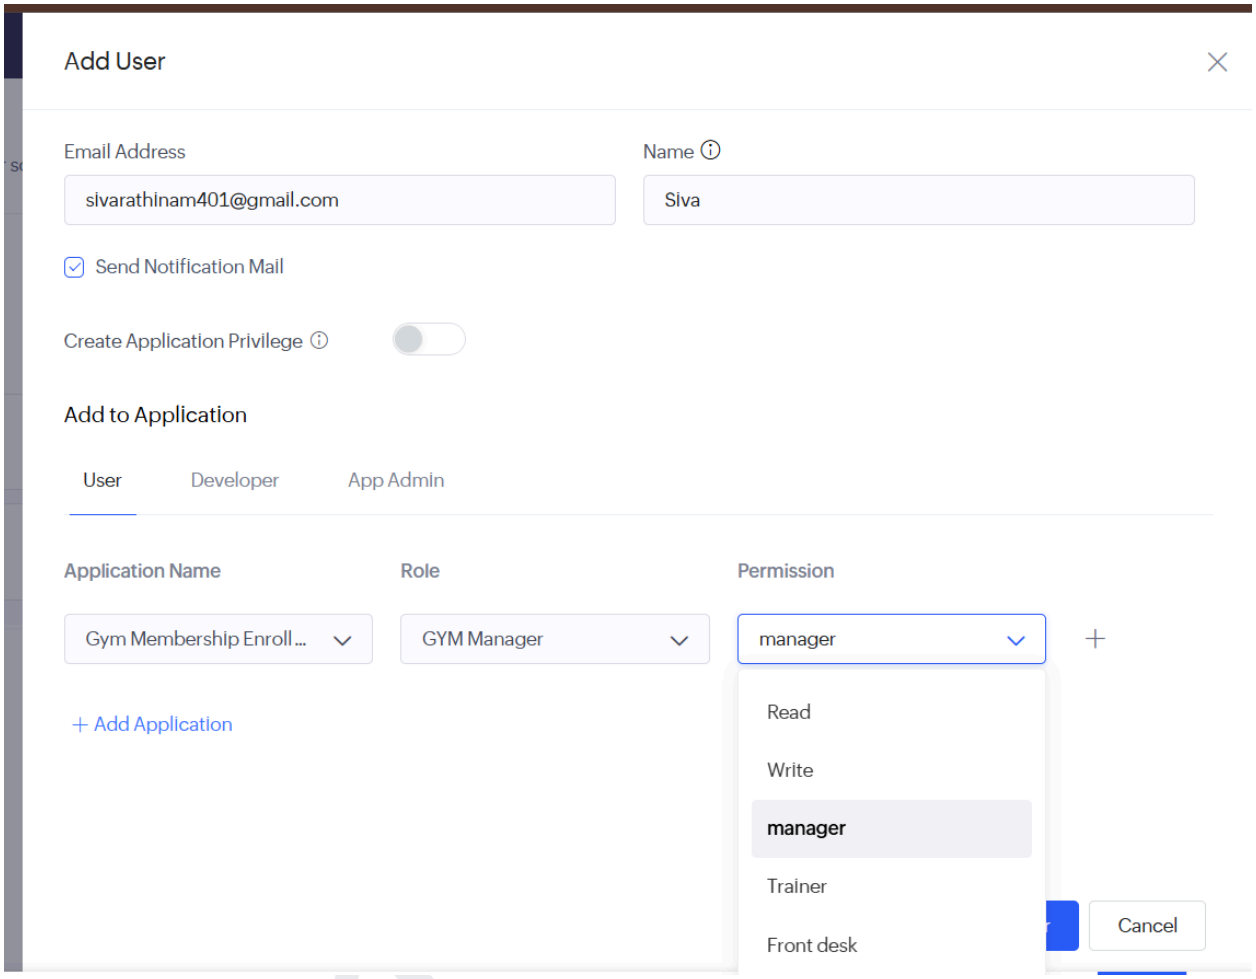

S.No	Issue	Cause	Fix
1	Message "Application shared with 0 out of 1 selected users"	The user already had access through the roles and users section, so there was nothing new to share	Changed the existing user's permission from Manage users instead of sharing again
2	Publish option not found in application Settings	In this version, Publish is on the Operations page of the Creator home	Opened Operations, then Publish, and published the form there

Screenshots

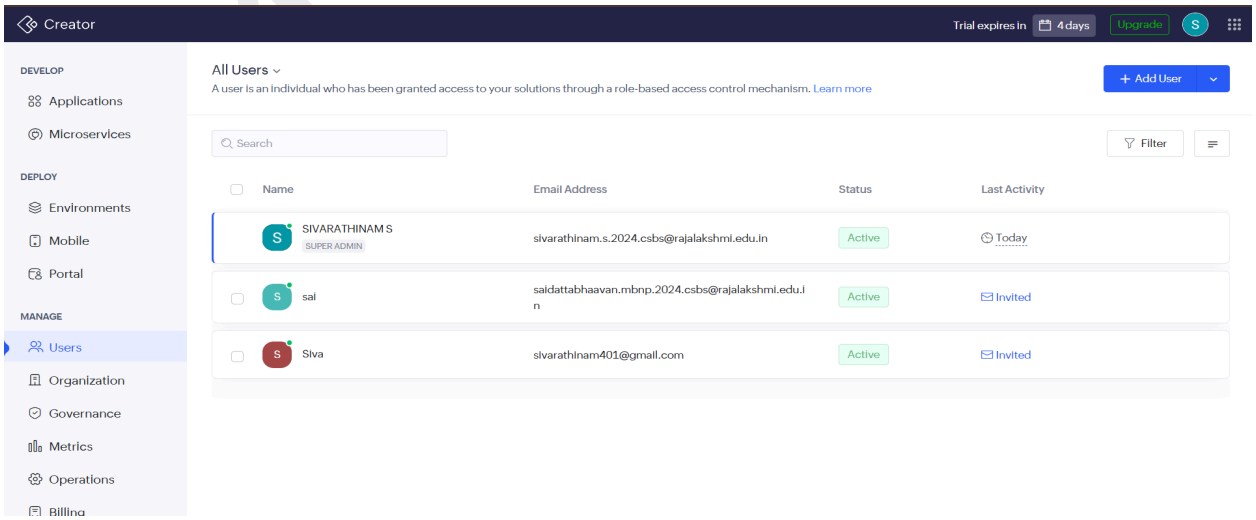

1. Permission sets (Manager, Front Desk, Trainer)

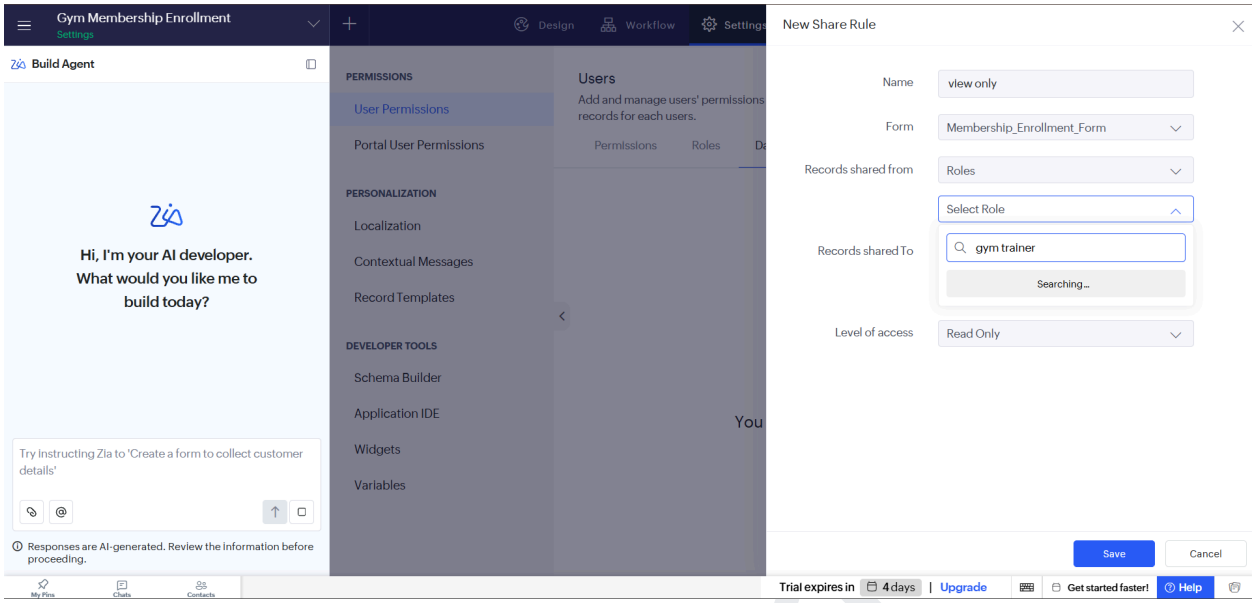

2. Roles and hierarch

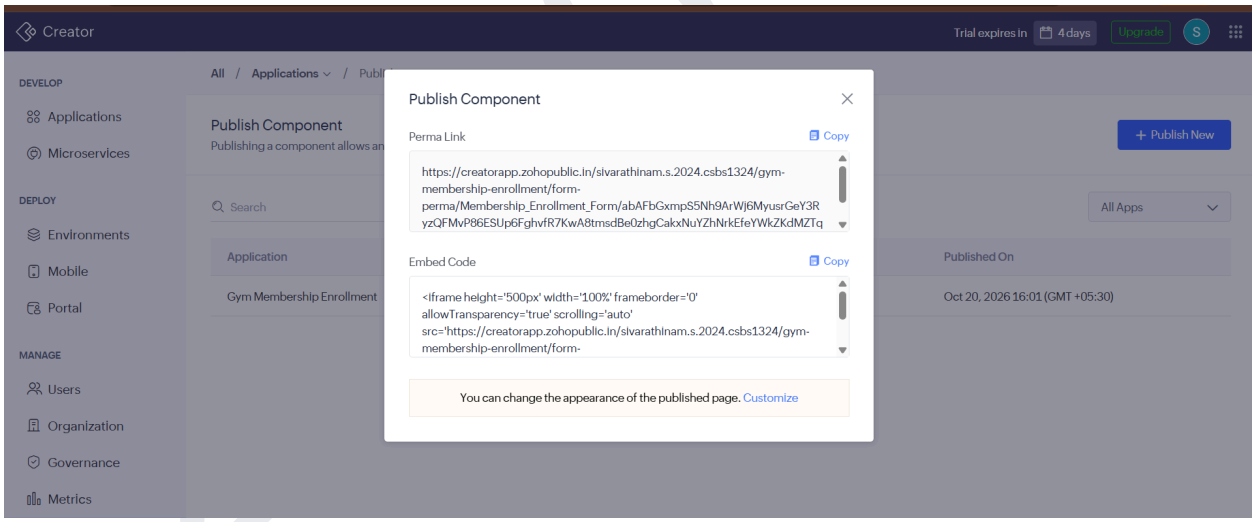

3. Users list with assigned permissions

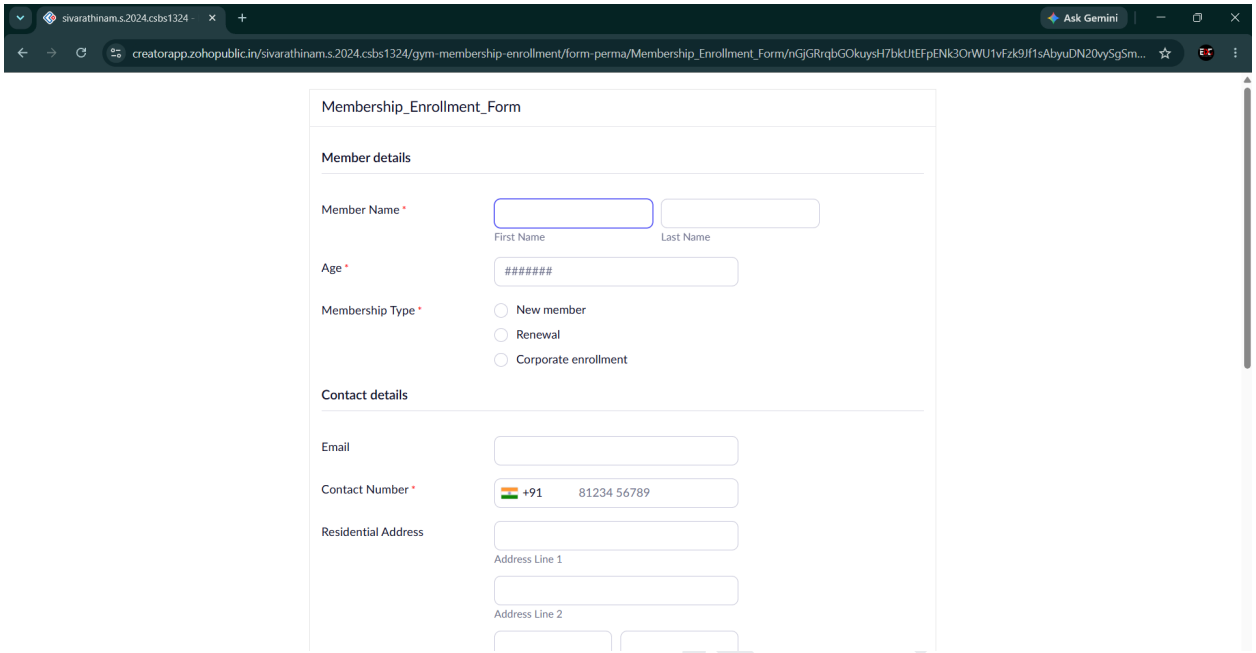

4. Data sharing rule

5. Operations page with Publish option

6. Published form permalink and the public form in an incognito window

Result

User management and role-based access control were configured for the Gym Membership Enrollment application using permission sets, roles, user assignments and data sharing. The enrollment form was published for public use, while the report and dashboard remain restricted to authorized roles, and the access of each role was verified by testing.
